Online Longevity Courses — Live Longer, Live Stronger

Self-paced courses in healthspan, metabolism, and cellular aging — taught by leading researchers and clinicians. Start free, learn at your own pace, and turn the latest longevity science into daily habits.

Browse the Course Catalog

40+ courses on aging, sleep, nutrition, and exercise.

Free Intro: Longevity 101

A 7-day primer on what extends healthspan — no card required.

Meet the Faculty

Researchers from Stanford, Buck Institute, and Mass General.

Pricing & Memberships

Single courses or unlimited annual access from \$19/mo.

Coursera · <https://www.coursera.org> > longevity

Longevity Science Specialization — 5 Course Series

Learn the biology of aging, evidence-based interventions, and how to translate research into longer healthspan...

1:1 Healthspan Coaching — Personalized Plan in 14 Days

Work directly with a board-certified healthspan coach. Bloodwork review, sleep & metabolic plan, and weekly check-ins designed around your goals. **Free 20-minute consult — no obligation.**

Book a Free Consult

Speak with a coach this week — most slots fill within 48 hours.

Member Outcomes

Average -14% LDL and +1.2 hrs sleep within 90 days.

How the Program Works

12-week roadmap: assess, intervene, measure, and adjust.

Plans from \$149/mo

HSA/FSA eligible. Cancel anytime in your first month.

Levels Health · <https://www.levelshealth.com> › coaching

Metabolic Health Coaching for Healthspan

Continuous glucose monitoring + 1:1 coaching to optimize metabolic flexibility and long-term wellness...

Anti-Aging Science, Made Practical — Free Research Briefs

Plain-English summaries of the latest peer-reviewed studies on senescence, NAD+, rapamycin, and more. Curated weekly by researchers, delivered to your inbox — **no hype, no supplements pitch.**

Latest Research Briefs

This week: senolytics in humans, sleep & epigenetic age.

Free Weekly Newsletter

20,000+ readers. One issue, five studies, ten minutes.

Beginner's Guide to Aging

The hallmarks of aging, explained without jargon.

Live Q&A With Researchers

Monthly sessions with scientists from leading aging labs.

Nature · <https://www.nature.com> > subjects > ageing

Ageing — Latest research and reviews

Find the latest peer-reviewed research on the biology of aging, longevity interventions, and lifespan studies...

CHAPTER 02

Blogs.

Six blog posts written for the Longevity Life Academy website. Each post covers a core longevity topic — sleep, metabolic health, nutrition, movement, biomarkers, and supplementation. Language is direct, clinically grounded, and accessible. Written to match the voice of leading longevity practitioners while remaining clear for a general adult audience.

01 Why Your Brain Feels Older Than the Calendar

02 Mindset Is Upstream of Every Longevity Lever

03 Skin Is a Barrier Organ — Treat It Like One

04 Five Foundational Supplements That Actually Move the Numbers

05 Silent Plaque: How Atherosclerosis Builds Before Symptoms

06 What to Eat to Protect Your Vision for the Next Forty Years

Why Your Brain Feels Older Than the Calendar

360 words

Topic: Cognitive aging, vascular health, novelty

Image: high-contrast photo of a person walking outdoors at first light — emphasizes circadian rhythm and novelty.

The first sign of aging is rarely a lab marker. It is the feeling that the years are running together. Time speeds up because the brain encodes fewer novel events — and that pattern is reversible.

Subjective time tracks memory density

Your sense of time is built on the number of distinct memories your brain stores. Childhood feels long because almost every input is new. Adult life feels short because most days repeat. Fragmented sleep and chronic stress make this worse — both interfere with memory consolidation.

What changes in the aging brain

Brain volume drifts down in the hippocampus and prefrontal cortex. Vascular and metabolic stressors — high blood pressure, glucose variability, elevated ApoB — quietly damage the small vessels the brain depends on. The variability across people is the strongest argument that lifestyle matters.

The levers with the most evidence

Protect the vasculature. Lower ApoB, keep insulin sensitivity intact, and build VO2 max. Defend deep and REM sleep. Stay socially engaged. Then add deliberate novelty — a demanding new skill, an unfamiliar route, focused work without multitasking.

Pick one demanding skill you are a beginner at and practice it weekly. Pair it with sleep, Zone 2 cardio, and a stable glucose curve.

Longevity Life Academy goes deeper into each of these levers in our cognitive-aging course.

Mindset Is Upstream of Every Longevity Lever

360 words

Topic: Identity, expectation, attribution, focus

Image: clean editorial portrait, mid-life subject, eye-level — no stock-photo "joyful senior" energy.

Diet, training, and lab work get the attention. The story you tell yourself about aging decides whether any of it sticks. Mindset is the input layer for behavior, and behavior is the input layer for biology.

The scripts most of us inherit

"Decline is automatic." "Learning is for the young." These ideas arrive in jokes, advertising, and offhand comments, then harden into filters. If you assume decline is inevitable, you stop investing the effort that would change the curve.

How beliefs become biology

Two people with the same ApoB, VO2 max, and sleep score will end up in different places ten years apart if one keeps training and one stops. The belief decides whether they keep showing up.

Four levers worth working on

Identity. Replace fixed labels with descriptions of current habits. **Expectation.** Move from "this gets worse no matter what" to "this gets worse without attention." **Attribution.** Blame specific causes — sleep, practice, workload — before age. **Focus.** Deliberately collect evidence of competence to counter negativity bias.

Spend a week writing down what you actually say about your age and your brain. Rewrite the recurring lines into something more precise.

The mindset module at Longevity Life Academy turns this into a four-week protocol.

Skin Is a Barrier Organ — Treat It Like One

355 words

Topic: Stratum corneum, transepidermal water loss, glycation

Image: macro shot of skin texture in natural light — no beauty-industry lighting.

Skin is the largest organ in the body and the main barrier against pathogens, water loss, and oxidative damage. How well that barrier works affects systemic inflammation — and systemic inflammation affects healthspan.

What the barrier actually does

The stratum corneum is built like a brick wall: dead cells held together by a lipid mortar of ceramides, cholesterol, and fatty acids. When the barrier holds, irritants stay out, water stays in, and the immune system has fewer fires to fight.

What erodes it

UV radiation damages DNA and breaks down collagen. Smoking and pollution generate oxidative stress. Over-cleansing strips the lipid mortar. Dry indoor air drives transepidermal water loss. Poor glycemic control glycates collagen and stiffens the dermis.

A longevity-first routine

Protect. Daily broad-spectrum sun protection. Avoid tobacco. **Support.** Mild cleanser, a moisturizer with humectants, emollients, and occlusives. Add a retinoid only when the base is stable. **Coordinate internally.** Adequate protein, omega-3s, stable glucose, and sleep.

Strip the routine to four steps: sunscreen, mild cleanser, barrier moisturizer, and one evidence-based active. Add anything else only after that base is stable.

For deeper protocols, see the skin and inflammation lessons inside Longevity Life Academy.

Five Foundational Supplements That Actually Move the Numbers

370 words

Topic: Magnesium, fiber, omega-3, vitamin D, K2

Image: overhead shot of a small ceramic dish with five capsules — no shiny e-commerce gloss.

Most durable benefit comes from a small set of unglamorous basics that support metabolic health, vascular function, and bone integrity. Five worth the cabinet space.

1. Magnesium

Hundreds of enzymatic reactions, including ATP production, blood pressure, and glucose control. Glycinate or citrate. Start low — high doses cause GI symptoms.

2. Fiber

The most under-consumed nutrient in the modern diet. Blunts post-meal glucose spikes, lowers LDL, and feeds gut microbes. Psyllium husk is the simplest fix to reach 30+ grams a day.

3. Omega-3 (EPA + DHA)

Structural fats in neuronal and cardiovascular tissue. Modulate inflammation toward resolution, lower triglycerides. Two to three servings of fatty fish weekly, or a tested supplement.

4. Vitamin D — when low

Acts more like a hormone. Test, dose to a target, re-test. Both deficiency and excess matter.

5. Vitamin K2

Activates the proteins that put calcium into bone and keep it out of arterial walls. Pairs naturally with vitamin D.

Start with measurement: vitamin D, lipid panel including ApoB, fasting glucose, and a dietary audit. Add only what the data and the diet justify.

Our supplement framework module at Longevity Life Academy walks through this protocol in detail.

Silent Plaque: How Atherosclerosis Builds Before Symptoms

365 words

Topic: Endothelial function, ApoB, plaque rupture

Image: editorial diagram of an artery cross-section, or a clean photo of a CAC score readout.

Most heart attacks and strokes are not sudden. They are the final chapter of a process that has been building inside the arteries for decades.

Arteries are tissue, not pipes

The endothelium senses pressure, flow, and blood chemistry. When blood pressure runs high, ApoB-bearing particles are elevated, and oxidative stress is constant, the endothelium becomes dysfunctional. That is where plaque starts.

How plaque forms

LDL particles cross the wall, oxidize, and attract macrophages that become foam cells. Smooth muscle migrates in, a fibrous cap forms, and calcium stiffens the lesion. The earliest fatty streaks are silent.

The dangerous moment is rupture

The most lethal plaques are not always the largest — they are the ones with thin caps. When a cap ruptures, the clotting cascade fires, and a thrombus can occlude the artery in minutes.

What pushes it forward — and what slows it

Forward: blood pressure, ApoB, smoking, insulin resistance, visceral adiposity. Slowing: lower ApoB aggressively, treat blood pressure to target, stop smoking, build VO2 max. Cumulative, not fast.

Treat ApoB and blood pressure as primary numbers. Get a baseline lipid panel and — when indicated — a coronary calcium score, while you still have decades of runway.

The cardiovascular pathway course at Longevity Life Academy goes deeper into testing and targets.

What to Eat to Protect Your Vision for the Next Forty Years

360 words

Topic: Carotenoids, DHA, retinal microvasculature

Image: overhead plate — leafy greens, salmon, citrus, nuts, eggs. Natural light, no styling.

Vision tracks what you eat, how stable your glucose is, and how well you protect it from light. It is one of the more responsive systems in the body.

Why the eye is unusually exposed

The retina has one of the highest oxygen demands in the body and is hit directly by light. It depends on a microvascular network so fine that anything damaging small vessels — hyperglycemia, high blood pressure, smoking — shows up early.

Nutrients with the strongest links

Lutein and zeaxanthin concentrate in the macula and filter blue light. **DHA** is structural in photoreceptor membranes. **Vitamins C and E** protect against oxidative stress. **Zinc** is required for retinal metabolism and vitamin A transport.

Vascular and metabolic health is the foundation

The retina is essentially a vascular bed you can see through a camera. Stable glucose, ApoB in range, and controlled blood pressure protect the eye for the same reason they protect the brain.

Habits beyond food

UV-blocking sunglasses outdoors. The 20-20-20 rule for screens. Time outdoors. Quit smoking — a major risk factor for macular degeneration and cataracts.

Daily: leafy greens and a colorful vegetable. Weekly: two to three servings of fatty fish. Ongoing: stable glucose, controlled blood pressure, sunglasses, an annual eye exam.

Our nutrition pathway at Longevity Life Academy maps this into a weekly meal framework.
